Trust the Machine? Conceptualising Trust in the Age of Generative Artificial Intelligence

The Project

Trust has traditionally been defined as the relation between two human beings – the trustor and trustee; however, the concept of trust is now applied to generative AI (GenAI) systems such as ChatGPT.

This usage of human concepts for non-human subjects opens the potential for a conceptual mismatch and challenges how what qualities we ascribe to new technologies such as GenAI.

In my dissertation, I analyse the ethical implications of using human concepts such as trust for human-AI interactions.

Research Methods in Focus

Experimental philosophy – a combination of traditional conceptual methods from philosophy and empirical data-gathering methodology from STS (semi-structured qualitative expert interviews).

Interdisciplinary Approach

Both my BA and MSc were interdisciplinary.
I believe that the current challenges presented by new technologies such as GenAI cannot be understood from a single discipline.

Project Contribution

This project will contribute to technology by offering guiding principles for programmers for the communication of the abilities of AI to the public.
