Vienna Doctoral College on Digital Humanism

Visualization of Argumentation Networks

Project

Arguing is a common way of resolving conflicts. Yet the network-like structure of even small-scale argumentations is often quite hard to understand without substantial effort.

This projects aims to design and investigate novel ways of modelling and visualizing argumentation networks in a human-friendly fashion.

- data science
- communication science

Contribution

- mediation processes
- analysis of multi-party discourses
- deliberation platforms

Visualization of coherent sets of arguments (called: *extensions*) based on colored nodes and edges.

From: Nöllenburg, et al. (2024) *Visualizing Extensions of Argumentation Frameworks as Layered Graphs.*

Methodology

- adapt and extend existing argumentation formalisms, allowing for advanced user interfaces
- **develop layout objectives**, ensuring stability over time in dynamic settings
- investigate interaction techniques, respecting the mental map of users
- apply state-of-the-art visual data analysis, addressing scalability δ explainability issues
